

## NOTE ON THE INVOLUCRAL LEAVES OF SYNDESMON.

F. H. BURGLEHAUS.

*Synedesmon thalictroides* is described in Britton & Brown's Flora as having sessile involucral leaves, which character is contradicted in the plants growing in the vicinity of Toledo. Careful observation during the past season fails to reveal a single instance of sessile involucral leaves, and most of the specimens examined have these leaves borne on petioles from one-fourth to one-half inch in length. Should like to hear from others concerning this feature of one of our most beautiful and dainty spring flowers.

*Toledo, Ohio.*
